

# What Happens When You Type google.com and Press Enter?

Aayush Adhikari

10<sup>th</sup> June, 2024

# Introduction

- ▶ This presentation explains the step-by-step process that occurs when you type "google.com" and press enter.
- ▶ We will cover DNS resolution, establishing a connection, HTTP request and response, server processing, and webpage rendering.

# Introduction Description

- ▶ Understanding these processes is crucial for web development and networking.
- ▶ We will use analogies and diagrams to simplify the technical concepts.
- ▶ By the end of this presentation, we will have a clear understanding of the entire process.

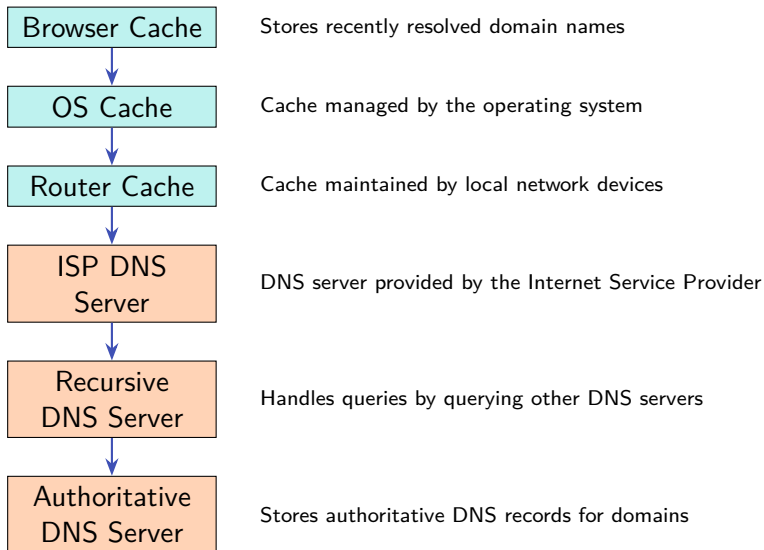

# DNS Resolution

- ▶ DNS (Domain Name System) translates domain names into IP addresses.
- ▶ Steps involved in DNS resolution include checking browser cache, OS cache, router cache, ISP's DNS server, recursive DNS servers, and authoritative DNS servers.

# DNS Resolution Description

- ▶ DNS acts like a phone book for the internet, mapping human-readable domain names to machine-readable IP addresses.
- ▶ When you type "google.com", the browser first checks its own cache to see if it already knows the IP address.
- ▶ If not, it queries the OS cache, then the router cache, and so on until it reaches an authoritative DNS server.

# DNS Resolution Process

# Establishing a Connection

- ▶ Once the IP address is obtained, the browser establishes a connection using TCP/IP.
- ▶ This involves a three-way handshake:
  - ▶ SYN: Client sends a synchronization packet to the server.
  - ▶ SYN-ACK: Server acknowledges with a synchronization-acknowledgment packet.
  - ▶ ACK: Client sends an acknowledgment packet back to the server.
- ▶ For secure connections, the TLS/SSL handshake is also performed.

# Establishing a Connection Description

- ▶ TCP/IP ensures reliable communication between the client and server.
- ▶ The three-way handshake sets up a reliable connection:
  - ▶ SYN: "Hello, I'd like to connect."
  - ▶ SYN-ACK: "Hello, I acknowledge your request."
  - ▶ ACK: "Great, let's start communicating."
- ▶ For HTTPS, additional steps include exchanging encryption keys to secure the communication.

# TCP Three-Way Handshake

Client	Step	Server
Port: 12345		Port: 80
Sends SYN Seq=x	1	
	2	Sends SYN-ACK Seq=y, ACK=x+1
Sends ACK Seq=x+1, ACK=y+1	3	
Connection Established

Figure: Three-Way Handshake

# HTTP Request

- ▶ After the connection is established, the browser sends an HTTP request to the server.
- ▶ Structure of an HTTP request:
  - ▶ Request line (e.g., GET / HTTP/1.1).
  - ▶ Headers (e.g., Host, User-Agent).
  - ▶ Body (for POST requests).
- ▶ Common HTTP methods: GET, POST, PUT, DELETE.

# HTTP Request Description

- ▶ The HTTP request is like asking a librarian for a book:
  - ▶ Request line: "I want to get the homepage (GET /)."
  - ▶ Headers: Additional information about the request, like who is asking (User-Agent).
  - ▶ Body: The actual data sent to the server (for POST requests).
- ▶ GET requests fetch data, while POST requests send data to the server.

# HTTP Request Example

```
GET / HTTP/1.1  
Host: google.com  
User-Agent: Mozilla/5.0  
Accept: text/html
```

# Server Processing

- ▶ The server receives the request and processes it.
- ▶ Server processing involves:
  - ▶ Interpreting the request.
  - ▶ Retrieving data from databases or other sources.
  - ▶ Generating a response.

# Server Processing Description

- ▶ The server acts like a chef in a restaurant:
  - ▶ Interpreting the request: Understanding what dish (data) you want.
  - ▶ Retrieving data: Gathering the ingredients (data) from the kitchen (database).
  - ▶ Generating a response: Preparing and serving the dish (response) back to you.
- ▶ The server uses backend logic and databases to create the appropriate response.

# HTTP Response

- ▶ The server sends an HTTP response back to the client.
- ▶ Structure of an HTTP response:
  - ▶ Status line (e.g., HTTP/1.1 200 OK).
  - ▶ Headers (e.g., Content-Type, Content-Length).
  - ▶ Body (the actual content).
- ▶ Common status codes:
  - ▶ 200 OK: The request was successful.
  - ▶ 404 Not Found: The requested resource was not found.
  - ▶ 500 Internal Server Error: A server error occurred.

# HTTP Response Description

- ▶ The HTTP response is like the librarian giving you the book:
  - ▶ Status line: Indicates whether the request was successful (200 OK) or if there was an error (404 Not Found).
  - ▶ Headers: Additional information about the response, such as the type of content being sent (Content-Type) and its length (Content-Length).
  - ▶ Body: The actual data or content requested (e.g., HTML of the webpage).

# HTTP Response Example

```
HTTP/1.1 200 OK
Content-Type: text/html
Content-Length: 1234

<html>
<head>
<title>Google</title>
</head>
<body>
<h1>Welcome to Google</h1>
</body>
</html>
```

# Rendering the Webpage

- ▶ The browser processes the received HTML, CSS, and JavaScript to render the webpage.
- ▶ The rendering process involves:
  - ▶ Parsing HTML to construct the DOM (Document Object Model).
  - ▶ Applying CSS to style the elements.
  - ▶ Executing JavaScript to add interactivity.

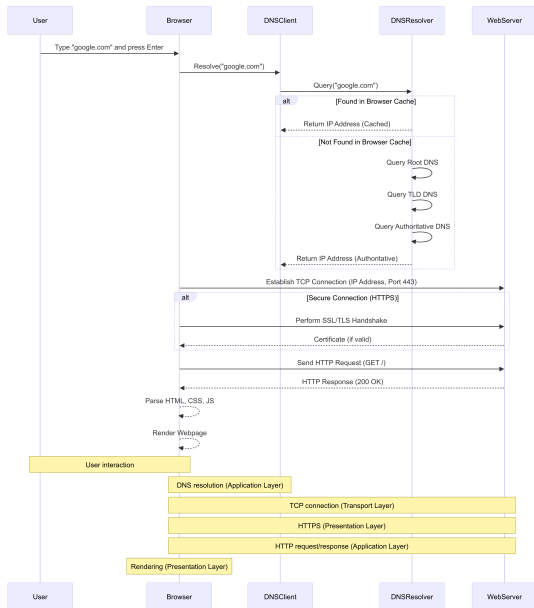

# Rendering the Webpage Description

- ▶ The browser acts like an artist creating a painting:
  - ▶ Parsing HTML: Sketching the basic outline (structure) of the painting.
  - ▶ Applying CSS: Adding colors and styles to the sketch.
  - ▶ Executing JavaScript: Adding moving parts or interactivity to the painting.
- ▶ This process ensures that the webpage appears as intended by the web designers.

# Rendering Process

# Sequence Diagram

# Conclusion

- ▶ We have covered the complete process from typing a URL to displaying a webpage.
- ▶ Each step is crucial for ensuring that web content is delivered accurately and efficiently.
- ▶ Understanding this process helps in diagnosing issues and optimizing web performance.

# Conclusion

- ▶ Recap of the steps:
  - ▶ DNS resolution to find the IP address.
  - ▶ Establishing a connection using TCP/IP.
  - ▶ Sending an HTTP request to the server.
  - ▶ Server processing the request and sending back an HTTP response.
  - ▶ Browser rendering the webpage using HTML, CSS, and JavaScript.
- ▶ This process is repeated millions of times every day, making the internet an integral part of our lives.
